

# Where on Earth (and the Human Body) is the Microbial World?

© 2007-2015 James Bier

On the cross section of the earth, shade in the areas where microbes can be isolated. Make the areas darker where more microorganisms can be found, lighter where few microbes are present, and leave the areas where no microbes are present blank.

On these three figures of the human body, shade in the areas where microorganisms reside. Indicate the concentration of microorganisms by the intensity or darkness of the shading. Note that the third figure does not include the female reproductive tract; please include it in your analysis.
